AI integrated smart quiz

Smart quiz + scoring

Connects to my previous work on adaptive scheduler

Connects quiz answers to breezy's pricing

Fun branding + dynamic result

make it adaptive? smart quiz? scoring!!

Pseudocode

Smart Plan Finder - core scoring idea

3 plans: casual, power, enterprise
scores = {casual: 0, power: 0, enterprise: 0}
questionIndex = 0
TOTAL_QUESTIONS = 5

each question's answers are just pre-set point values per plan
e.g. picking "answer A" on Q1 might add +2 casual, +0 power, +0 enterprise

onAnswerClick(qIndex, pointsForThisAnswer):
 add pointsForThisAnswer to scores
 questionIndex = qIndex + 1

figure out who's winning so far
leader = plan with highest score in scores
total = sum of all scores
confidence = scores[leader] / total # as a %, only meaningful once total > 0

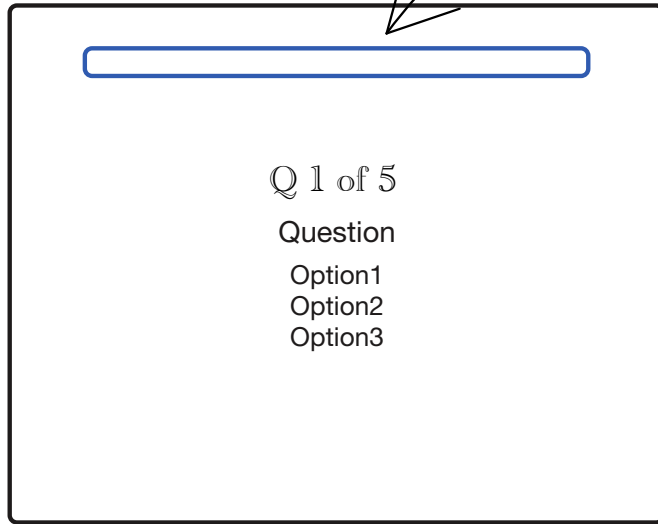

IF questionIndex < TOTAL_QUESTIONS:
 show next question
 update "leaning toward {leader} ({confidence}%)" hint text
ELSE:
 showResult(leader, confidence)

showResult(leader, confidence):
 display leader's plan name + a canned reason string per plan
 maybe show a small bar per plan = scores[plan] / total, so user can see
 the breakdown instead of just trusting a black-box verdict
 add a button that scrolls down and highlights the matching pricing card

restartQuiz():
 reset scores back to 0
 reset questionIndex to 0
 hide result, show question 0 again

note to self: don't overthink this into real bandit math, there's no
session history to learn from in a single quiz run, adding fake "learning"
would just be decoration
